# How to Weigh Your Horse Without a Scale

Knowing is important, not just for feeding, but also for medications, dewormer, and general health tracking. Don't happen to own a horse-sized scale? Here's the easy way!

**Estimating actual bodyweight**

(Weight in pounds; girth, length in inches)

| STEP 1 | STEP 2 | STEP 3 |
|---|---|---|
| **LENGTH** Measure from point of shoulder, straight along the side, to the point of horse's rear; as shown (requires two people). | **HEART GIRTH** Start at the highest part of the withers (keeping tape as close behind the elbows as possible), measure circumference. | **DO THE MATH** Plug numbers into the weight formula (below) and viola! Don't forget to plug the Heart Girth in twice. |

### ADULT HORSE

$$\text{Bodyweight} = \frac{[\text{Heart Girth} \times \text{Heart Girth} \times \text{Body Length}]}{330}$$

### YEARLING

$$\text{Bodyweight} = \frac{[\text{Heart Girth} \times \text{Heart Girth} \times \text{Body Length}]}{301}$$

### WEANLING

$$\text{Bodyweight} = \frac{[\text{Heart Girth} \times \text{Heart Girth} \times \text{Body Length}]}{280}$$
